SALES PERFORMANCE ANALYSIS

Excel-based analysis of FMCG sales data | 2022–2024

PROJECT OVERVIEW

This project analyzes three years of transactional sales data to understand revenue trends, product and brand performance, regional contribution, sales-channel mix, and promotional activity. Microsoft Excel features—including Power Query, calculated fields, PivotTables, charts, and an interactive dashboard—were used to turn raw transactions into a structured business-performance view.

■39.9M	7.6M	163.6%
Total revenue	Units sold	Revenue growth (2022–2024)

BUSINESS OBJECTIVE

Build a consolidated view of sales performance that helps identify growth drivers, underperforming products, regional and channel differences, and opportunities to improve promotional measurement and inventory execution.

Dataset period: 2022–2024. Revenue is calculated as units sold × unit price. The analysis does not calculate profit or discount value because those measures are not present in the source fields.

1. Data & Methodology

Dataset fields

The dataset contains transaction dates, SKU, brand, segment, category, pack type, sales channel, region, unit price, units sold, delivered quantity, available stock, delivery days, and a promotion flag. The data covers Retail, E-commerce, and Discount channels across multiple regions.

Data preparation and calculated fields

- **Data preparation:** Imported the sales workbook into Power Query and standardized column data types.
- **Date features:** Created Year, Month, and MonthName from the transaction date.
- **Revenue:** Calculated as units_sold × price_unit.
- **Analysis structure:** Organized PivotTable views for time trends, category, brand, region, channel, promotion, and SKU performance.

Core calculations

Metric	Calculation
Year	YEAR(date)
Month	MONTH(date)
Month name	TEXT(date, "mmm")
Revenue	units_sold × price_unit
Revenue growth	(2024 revenue – 2022 revenue) ÷ 2022 revenue

Analysis views

- Monthly revenue and unit trends
- Category and brand revenue rankings
- Revenue contribution by region and channel
- Promotion versus non-promotion comparisons
- Top SKU revenue ranking and revenue per unit

2. Dashboard & Key Findings

Dashboard design

The dashboard consolidates headline KPIs and the main analytical views into one management-facing page. KPI cards report total revenue, total units sold, and revenue growth. Supporting charts show monthly trends, regional contribution, leading categories and brands, channel share, and promotional comparisons. Slicers are intended to filter the analysis by year, category, brand, region, channel, and promotion flag.

Headline results

Area	Finding
Overall performance	Revenue increased by approximately 163.6% from 2022 to 2024; total revenue shown in the dashboard is ■39.9M and total units sold are 7.6M.
Category performance	Yogurt is the leading category in the displayed analysis, with revenue of approximately ■8.23M. Milk and ReadyMeal form the next tier in the chart.
Brand performance	The displayed brand ranking shows SnBrand2 and several YoBrand brands among the leading revenue contributors.
Regional mix	Revenue is broadly balanced: PL-South contributes about 34%, while PL-Central and PL-North contribute about 33% each.
Channel mix	Retail, E-commerce, and Discount contribute nearly equal shares; Retail is marginally higher at about 34%.
Promotions	The source analysis shows lower totals for rows flagged as promotional and little price change. The flag alone does not prove promotional effectiveness.

Interpretation note: the available case-study outputs support revenue and volume comparisons, but not direct profitability conclusions. Revenue per unit is not the same as profit per unit.

3. Diagnostic Analysis & Recommendations

Product and category performance

- Review categories such as Juice and ReadyMeal where the displayed category chart indicates comparatively low revenue; validate both sales volume and revenue before changing assortment.
- Protect leading Yogurt SKUs and test new pack sizes or flavors where demand and channel data support expansion.
- Review low-revenue brands and SKUs for availability, placement, pricing position, and customer fit before deciding whether to rationalize them.

Promotion effectiveness

- Measure promotion performance using comparable periods and metrics such as units per day and revenue per day.
- Run controlled tests of promotion formats, including bundles or loyalty offers, and compare results by SKU, category, and channel.
- Treat promotion_flag as a campaign indicator rather than proof of a discount or causal sales uplift.

Regional and channel strategy

- Because the regional mix is relatively balanced, investigate local category and SKU differences rather than relying only on total regional revenue.
- Tailor assortment and campaign design to channel behavior; evaluate value packs for Discount, premium bundles for E-commerce, and core multipacks or in-store visibility for Retail.

Operational execution

- Monitor delivery_days and investigate exceptions against the approximately three-day delivery benchmark used in the case study.
- Set region- and channel-specific minimum-stock thresholds for high-revenue SKUs to reduce the risk of stockouts.

Further analysis required

Before making pricing or profitability decisions, incorporate cost, discount amount, margin, and campaign-period data if available. For promotion analysis, compare like-for-like periods and account for seasonality and product availability.

4. Conclusion

The 2022–2024 analysis shows strong revenue growth, led by Yogurt and a group of high-performing brands and SKUs. Revenue contribution is spread relatively evenly across the three regions and three sales channels, suggesting that the business is not dependent on a single geographic area or channel in the displayed results.

The most useful next steps are to protect high-performing products, diagnose weaker categories and SKUs, measure promotional effectiveness with comparable metrics, and strengthen inventory and delivery monitoring. The current promotion flag should be treated cautiously; further analysis is needed to establish whether promotions create incremental sales.

Project outputs

- Cleaned sales data with calculated date fields and revenue.
- PivotTable analyses covering time, category, brand, region, channel, promotions, and SKU.
- Executive-style dashboard concept with KPI cards, charts, and interactive filter controls.
- Business findings and recommendations based on the displayed results.

Tools & techniques

Tool / technique	Application
Microsoft Excel	Data analysis, formulas, PivotTables, charts, KPI reporting
Power Query	Data import, type standardization, and preparation
Dashboard design	KPI cards, visual summaries, and slicer-based filtering
Business analysis	Performance comparison, diagnostic questions, and recommendations

Data note: This report summarizes the figures and visuals in the supplied case-study PDF. The original material identifies the case study as Mantra Data Labs and references a separate FMCG sales workbook. Ensure the workbook, calculations, and dashboard are your own verified work before presenting this report as a personally completed project.
